

RECORD OF A NEONATE DWARF SPERM WHALE, *KOGIA SIMA* (OWEN, 1866) STRANDED ON THE COAST OF BAHIA, NORTHEASTERN BRAZIL¹

LUCIANO RAIMUNDO ALARDO SOUTO^{2,3,*}, LUANA MURITIBA LEMOS³,
THAIS HELENA A. S. VIOLENTE², AND RODRIGO MAIA-Nogueira^{2,3}

On 9 February 2005, at around 11:00h, a male neonate *Kogia sima* was rescued on Itapuã beach ($12^{\circ}57'22"S$, $38^{\circ}21'30"W$), Salvador, Bahia, and the CRMA (Centro de Resgate de Mamíferos Aquáticos) network was informed. According to witnesses, the neonate was found alive but injured on the rocks. At the time of collection, the animal had already died. The carcass was in a code 2 condition (Geraci and Lounsbury, 1993) and was not bloated (Figure 1a). The teeth were unerupted and the throat grooves were absent, a fact probably related to its young age. It had various external scratches and was missing a relatively small portion (~5%) of its epidermis due to trauma from shocks against reef rocks (Figure 1b). The animal measured 72.5cm in total length from tip of snout to tail notch [using a tape measure of 0.5cm precision; morphometrics adapted from Norris (1961)] and had a body mass of 10kg (measured with a balance scale of 100g precision). Evidence of recent scarring of the navel, as well as the presence of milk in the stomach (identified by its greasy consistency and viscosity)

indicated that the animal was lactating. All materials collected were deposited in the Scientific Collection of the Instituto Mamíferos Aquáticos, under classification number CCPM0209.

Considering the known range in total length for newborn *K. sima* (100-130cm) and comparing the case reported here with reported values for total body length (mean 95.4cm, maximum-minimum values 72.5-112.5cm and sd 14.08cm) (Kami and Lujan, 1976; Ross, 1979; Caldwell and Cadwell, 1989; Debrot and Barros, 1992; Hetzel and Lodi, 1993; Jefferson *et al.*, 1993; Brito, 1996⁴; Soto and Ternes-da-Silva, 1998⁵; Marcondes *et al.*, 2002⁶; Shirihai and Jarrett, 2006), it is evident that the specimen reported here (72.5cm) was much smaller. While we do not discount that this individual may have been an outlier, we suggest that the range be lowered to 72.5-130cm. Little is known about the biology of *K. sima* in Brazilian waters, and globally the species is classified as 'Data Deficient' (IUCN, 2010⁷).

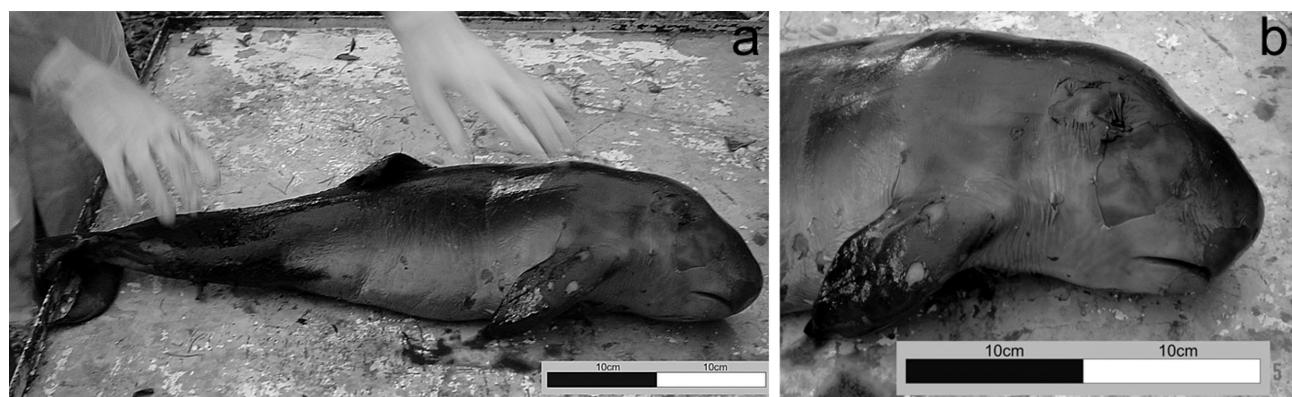

Figure 1. Neonate male dwarf sperm whale, *Kogia sima*, stranded at Itapuã beach, Salvador, Bahia (CCPM0209). (a) Lateral full body view. (b) Lateral head view.

It is clear that further information is needed on the biology and reproductive parameters of *K. simus* in this region.

Acknowledgements

To the Police Environmental Protection Division (COPPA), which helped with the rescue and transport of the animal; the fishing community of Itapuã beach, who reported the stranded animal and removed it from the water; to Liliane Lodi, Nélio B. Barros and Salvatore Siciliano for providing references; graphics support to Paulo Alves for the artwork in Figure 1, to Lauren Hopkins and Vanessa D'Oliveira for their translation of our manuscript and especially to Liliane Lodi, Cláudio L. S. Sampaio, Gerson de O. Norberto, José de Anchieta Nunes, Maria do Socorro S. dos Reis and two anonymous referees for their valuable suggestions on the manuscript.
